About the Author

Shreya Sunil is a 20-year-old vocalist, guitarist, keyboardist and music producer who finds solace through songwriting and poetry. Currently, she is pursuing her bachelor's degree in Psychology, Journalism and Media Studies. Through her first book **The Silent Storm**, she aspires to spread the pureness of vulnerability and portray the different aspects of life. She feels most at home while creating art as a form of self-expression, be it through music or poetry.

Her other interests revolve around skating, travelling, exploring and spreading mental health awareness. Having been a part of various organisations working towards creating a safer mental space for those in need, she believes in narrating her experiences in creative ways hoping to empathise with others in the same boat.

Abstract

Birds are the common group of organisms in any ecosystem; they are the important species that help in ecological balance and sustenance of biodiversity. They play very important role in pollination and also act as seed dispersers, scavengers, pest and rodent control. Urbanization and landscape modification has greatly affected global avian diversity and population due to the reduction of feeding and nesting resources. However, studies have reported diverse avian fauna in many human dominated cities. Natural or manmade urban structures can provide a heterogeneous range of habitats that can be used for managing biodiversity. Thus, the present study was conducted to understand the avian diversity in urban green and urban blue areas, two seminatural habitats in the city. A natural lake and seminatural green area located in the urban residential area in Madiwala, Bangalore were selected to document the bird diversity from November 2020 to February 2021. Observation was conducted by surveys in the study areas at particular time. Different diversity indices were used to analyze the data. Species diversity, evenness and abundance was found by comparing the values of Simpson and Shannon indices. During the study a total of 22 species belonging to 15 families were recorded. Individual population in urban blue area (395) was higher than urban green area (216). The species diversity was found to be greater in urban green area (22) than urban blue area (19). Shannon's diversity index indicated that urban green space (2.584) had higher species diversity than urban blue space (2.417). Similarly, insectivorous, nectivorous and frugivorous birds were abundant in urban green area in contrast to omnivorous and piscivorous species in the urban blue area. Our study confirmed that proper management and planning of urban green and blue areas can help in conservation of avian biodiversity in the anthropogenically altered urban habitats.

Abstract: Objective: People around the globe have been experiencing the outbreak of SARS-CoV-2, which has forced us to live in the 'Era of Pandemic'. The rapid spread of coronavirus has impacted us in ways beyond our imagination. The sector which has been most affected and cannot be compromised is, health. The virus has taken people of all age groups, even children under its grasp. Although no proper medication is known to cure the COVID-19, but the vaccines currently developed seem to be effective and safe. The paper is not restricted to one particular subject but covers all the areas related to the virus. Starting from its history, pathogenesis, symptoms and diagnostic techniques, new mutations, treatment till vaccination. It majorly outlines the present condition in India, impact of the virus and coping methods adopted. Method: Data was collected from authentic sources of World Health Organization, published journals and news sources.

Keywords: SARS-CoV-2, COVID-19, India, Treatment, Vaccination.

1. Introduction

Over the past few months, people all over the world have faced the toughest and most fearsome days of their lives. Being part of a pandemic, being locked up in your houses, the only way of communication being mobile phones & internet, without meeting anyone as you fear that you might get infected by the deadliest virus of all times – 'THE CORONA VIRUS' and suffer from the COVID-19 disease.

Since the influenza pandemic of 1918 and the Second World War (1939-1945), the world had not seen a global outbreak in recent memory like the COVID-19 pandemic [1]. The spread of the 2019 novel coronavirus (2019-nCoV) or severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) has threatened the world and pushed us into 'The Era of Pandemic' [2]. Despite the advancement in technology, science, and medicine, the modern world is impotent in finding the solution for an invisible yet destructive problem, the coronavirus. The situation of COVID-19 is getting worse day by day and the world is unable to get the situation under control. The virus has caused havoc and destruction and has taken the lives of millions of people all over the world, irrespective of their social differences, like being rich or poor, the country being developed or under-developed, educated or uneducated. It has impacted our lives on all facets but most importantly, our health. It contains emerging and re-emerging pathogenic characteristics and is capable of mutation at a faster rate which has been a

major health concern lately. SARS-CoV-2 is known to cause the 'COVID-19' disease, wherein, 'CO' stands for corona, 'VI' for the virus, and 'D' for disease. The name "Coronavirus" was recognized by the International Committee on the Taxonomy of Viruses (ICTV) and was first mentioned in the year 1968 [3].

The situation of pandemic arose from the rapid spread of the virus from person to person by inhalation or transmission of water droplets, either by sneezing or coughing. The infection originated in 2019 in Wuhan, China, and was spread to other countries by advanced modes of transportation. People were affected in a huge number all over the world and the death toll increasing many folds each day. Anyone with COVID-like symptoms is quarantined and their samples are collected (from nose or throat) immediately for diagnosis. RT-PCR (Reverse Transcription- Polymerase Chain Reaction) is the technique used for the diagnosis.

The second wave of COVID-19 infection in India is more infectious compared to the first wave due to new mutants being discovered and the death toll increasing many folds. Scientists and researchers have observed new symptoms like conjunctivitis or pink eye, dry mouth, unusual fatigue along with post- COVID symptoms in the recovered patients like black fungal, kidney damage, heart diseases [4, 5]. This study focuses on the history of the virus, its classification, global status, present scenario, diagnosis & possible treatments, and sheds light on the current vaccines being used & their effects in India. It also highlights the effects of the second wave of COVID infection among the people and its impact on India. The objective of this review paper is to study the 'Novel Corona Virus' and its impact which led to the pandemic and affecting not just an area, state, or country but the whole World. The motive of this review paper is to make the world aware of the COVID-19 situation in India and to spread awareness about the symptoms, medication, preventive measures, and highlights the facts about the vaccination methodology followed in India.

2. Literature Review

Since the 1800s, pathogenic outbreaks and their interaction with humans and animals are suspected to be a result of cross-species transmission, which poses threat to human well-being and physical security. One reason for this rapid spread and outbreaks can be globalization and advancement in human
